RIZZLER / WORK INTELLIGENCE

Rizzler Work Agent — Decision Intelligence

RESEARCH • ANALYSIS • DECISION SUPPORT

Prepared 08 November 2026 | Structured by specialist production skills

Editorial note

This report separates interpretation from recorded evidence. Check referenced sources and critical claims before external distribution.

01 / Executive Decision

Prioritize an evidence-first deployment model. Establish a measurable baseline, create a targeted experimentation plan and use explicit approval gates for high-impact actions. This report evaluates delivery quality, risks, observability and user value. The recommendation is to start with a narrowly scoped launch followed by measured expansion.

02 / Market Context and Opportunity

Teams increasingly expect an assistant to complete a deliverable, not merely generate a response. Opportunities include structured research, a reproducible analytical workflow and ready-to-use documents with traceable sources. Each task should produce artifacts designed for their medium, not automatically convert long text into slides.

03 / Research Methodology

Define a question, retrieve relevant evidence, assess its recency and record what is known. Separate claims from interpretations. Use source links only when returned by grounding metadata; never invent credentials, datasets or references.

04 / Analytical Findings

The core implementation benefits from deterministic data profiling, source-aware synthesis and format-specific generation. Data charts must originate from uploaded data rather than model-created measurements. A good report highlights the implication behind the finding and the next appropriate action.

05 / Product Experience

The Work Agent panel provides clear task requests, output format selection and a durable job timeline. Each job receives an identifier and an evidence-based status. This minimizes confusion during longer operations, while the voice front end remains responsive to other questions.

06 / Risk Management

Protect secrets through Kaggle Secrets and scoped execution. Prevent path traversal during dataset access and artifact download. Require explicit approval before any recurring scheduled automation. A clean output cannot substitute for correct research and a validated dataset.

07 / Implementation Roadmap

Phase one validates schema and source integrity. Phase two establishes document layout standards and datasets. Phase three adds supervised evaluation and design review. Phase four introduces persistent infrastructure outside ephemeral Kaggle sessions.

08 / Recommendations and Next Steps

Introduce acceptance gates for every format. Benchmark the workflow against known task sets and score content accuracy, structure, visual quality and completeness. Publish only after reviewers inspect the rendered PDF, Word document and presentation.
